Osseointegration is the direct structural and functional connection between living bone and the surface of a load-bearing artificial implant. A more recent definition defines osseointegration as "functional ankylosis ", where new bone is laid down directly on the implant surface and the implant exhibits mechanical stability. Osseointegration has enhanced the science of medical bone and joint replacement techniques as well as dental implants and improving prosthetics for amputees.

Osseointegration - Wikipedia

Osseointegration involves inserting a prosthetic implant into the residual bone of an amputee to which an external prosthesis can attach directly, thereby eliminating the need for a traditional socket-mounted prosthesis. This surgical solution utilises cutting-edge-technology to enhance the mobility and quality of life of amputees.
